SUMMARY

Frontend Developer who builds production web apps in React, TypeScript and Next.js. Track record of taking features from discovery with users and Figma prototypes through to release and monitoring. Experienced in design systems, data-heavy interfaces and REST and GraphQL APIs, with full-stack work in Node.js, Go and PostgreSQL. Skilled in testing, performance optimisation, accessibility and working with AI coding tools like Claude Code and Cursor. A trusted reviewer and mentor who documents systems so others can operate and extend them. Looking to bring the same ownership to a product team that cares about quality and real user impact.

SKILLS

Languages and runtimes: TypeScript, JavaScript, HTML5, CSS3, Node.js, Go, Python
Frameworks and libraries: React, Next.js, React Native, Redux, TanStack Query, TanStack Table, Apollo Client, D3, driver.js, Zod
UI and design: Tailwind CSS, Sass, MUI, shadcn/ui, Storybook, Figma
Testing and code quality: Jest, React Testing Library, Playwright, Chromatic, axe, ESLint, Prettier
Back end, APIs and security: PostgreSQL, Express, REST APIs, GraphQL, OpenAPI, Kubb, WebSockets, WebRTC, OAuth, JWT
Cloud, AI and dev tools: AWS (S3, CloudFront), GitHub Actions, Docker, Git, Webpack, Vite, Yarn, PostHog, Sentry, Claude Code, Cursor

EXPERIENCE

Reach Industries – Frontend Developer **Jan 2024 – Oct 2026**
Lab platform where scientists document data-heavy experiments while AI monitors each run, flags errors and analyses results, with live lab footage streamed into the platform.

- Owned features end to end across the experiment documentation app, AI monitoring views and live lab streaming, used by 10+ customer organisations. Ran discovery sessions with scientists and product owners, then prototyped in Figma and shipped.
- Worked cross-functionally with designers, product managers, marketing and sales teams to turn requirements into polished features.
- Created and maintained the shared design system and component library in Storybook, with visual regression testing in Chromatic.
- Redesigned the human-in-the-loop audit flow after users found it confusing. Reviewers could then check each completed protocol step, sign approvals and dispute errors made by the AI.
- Built an in-app guided onboarding system with driver.js, walking new users through key workflows step by step.
- Integrated REST and GraphQL APIs, with TanStack Query for REST data, Apollo Client for GraphQL and Redux for app state.
- Built real-time views with custom D3 components driven by live WebSocket streams, plus filterable TanStack Table data tables.
- Architected full-stack solutions across React, Go and PostgreSQL. Built a Node.js and Express backend-for-frontend layer.
- Proposed and led the Kubb rollout, generating type-safe API clients from the OpenAPI spec to keep the front end and back end in sync.
- Used PostHog to spot slow views, then cut their render times by 40% with memoisation and lazy loading.
- Resolved a live incident where rendering too many live-capture values slowed the page until AI-assisted experiments could not run. Paginated the returned data and cached the pages around the visible time range.
- Improved accessibility with semantic HTML, ARIA and axe audits. Led the move to a fully responsive web app, delegating pages and tasks to developers based on their strengths.
- Set the unit, E2E and visual test strategy with Jest, React Testing Library and Playwright. Re-engineered CI, cutting E2E builds from 22 to under 14 minutes (~35% faster).
- Added OAuth and JWT login plus role-based access control for the multi-tenant platform.
- Set team standards with ESLint, Prettier, CLAUDE.md files and Claude Code skills for reviewing human and agent-generated code.
- Handled front-end releases and deployments on AWS, shipping new features behind PostHog feature flags. Led code reviews, mentored developers and wrote technical docs.

RMR Property Investments – Junior Frontend Developer **May 2022 – Dec 2023**

- Built customer dashboards, internal web apps and parts of the marketing website in an early-stage startup of about 30.
- Built screens, components and navigation for the React Native mobile app, published on the App Store and Google Play.
- Migrated the application codebase from JavaScript to TypeScript, improving type safety and making refactoring easier.
- Cut page load times by 45% with Webpack code splitting and reduced unnecessary re-renders by memoising components.
- Led the migration of all styling from Sass to Tailwind CSS, building responsive layouts with CSS Grid and Flexbox.

Wanstor – Technical Consultant **Mar 2021 – Apr 2022**

- Deployed security patches across client devices and managed Active Directory and SQL Server environments for client organisations.

EDUCATION

University of Kent – BEng (Hons) in Biomedical Engineering with Computing (1st Class)

HOBBIES

3D character design, 3D animation, reading and critiquing movies.
